

CLIENT > 29er World Championships - Administration
 PROJECT > Web Site Architecture/Development/Maintenance
 DATE > July, '01

OBJECTIVES > Create a web site back-end for the 29er World Championships for content providers.

SOLUTION > Since the action was happening live there was no time or resources to "hard code" content. By using PHP we were able to create administrative pages where users could simply type in content, add photos and click submit. The content would automatically be added to the web site through the web browser.
